Ramakrishna Gampa

Software AI Engineer | Building AI-Powered Applications with LLMs, RAG & Agentic AI | Python · FastAPI · React · TypeScript | Docker · Linux · Azure | M.S. Computer Science
Cincinnati, Ohio, United States

Summary

I'm a Software AI Engineer. I design and build AI-powered applications end to end: the LLM and RAG layer, the Python backend, and the React front end.What I build:→ LLM and RAG applications that answer questions from your own documents→ Agentic AI workflows that take actions, not just chat→ Python and FastAPI backends and REST APIs→ React and TypeScript front ends→ Machine learning and computer vision models inside appsRecent work:→ Nexus AGI: a private AI voice assistant that runs fully on local hardware, with RAG document search, long-term memory and agentic system control. Built with Python, FastAPI, Docker and WebSockets.→ CrossMind AI: a computer vision prototype using OpenCV that detects a pedestrian waiting at a crosswalk and sends the WALK request through a FastAPI backend, with no button press.→ Smart Inventory AI: working on the backend for a platform that forecasts demand spikes from past sales data in Python, running locally with no cloud APIs.→ MAK Engineering Services: built AI-integrated web apps with React, Node.js and Python, including ML models for energy forecasting and fault detection.At Jabil, I work on software and systems debugging: finding root causes in Linux systems through logs and automating checks with scripts. It's made me better at building AI systems that are easy to test, monitor and fix.M.S. in Computer Science, University of Cincinnati · 3.96 GPACore skills:AI / ML: LLMs, RAG, Agentic AI, Prompt Engineering, Vector Search, TensorFlow, Scikit-Learn, OpenCVBackend: Python, FastAPI, Node.js, Express, REST APIs, SQLFrontend: React, TypeScript, JavaScriptDevOps and Tools: Docker, Linux, Git, GitHub Actions, CI/CD, Azure, pytest

Experience

Jabil
Software & Systems Debugging

June 2026 - Present (5 months)
Florence, Kentucky, United States

Debugging Linux systems and software issues at Jabil, focused on finding the root cause fast and keeping systems stable.

• Troubleshoot Linux systems by reading system logs, monitoring data and diagnostic tool output to find the root cause of software failures.
• Diagnose network service problems such as DHCP and DNS, and check connectivity across servers.
• Configure and validate Linux systems, including system settings and baseline testing before they go into use.
• Apply software updates and patches, then check system stability, compatibility and performance after each update.
• Write scripts to automate routine diagnostics, system health checks and log monitoring.
• Analyze system data and logs to spot recurring issues, performance trends and anomalies.
• Document configurations, troubleshooting steps, fixes and system logs so the team can reuse them and improve the process.
• Follow security and access control standards when handling systems and data.

Skills: Linux · Shell Scripting · Log Analysis · Root Cause Analysis · Software Debugging · Troubleshooting · DHCP · DNS · System Monitoring · Patch Management

MAK Engineering Services

AI Full Stack Developer

May 2025 - April 2026 (1 year)
Columbus, Ohio Metropolitan Area

Built AI-integrated full stack web applications for solar, EV and LED system platforms, from the APIs and data pipelines to the user interface.

• Designed and developed full stack web apps using React.js, Node.js and Python to support day-to-day operations across solar, EV and LED systems.
• Built RESTful APIs and automated data pipelines for real-time system monitoring, cost forecasting and sustainability tracking.
• Integrated machine learning models into the application backend to power predictive analytics for energy efficiency and fault detection.
• Built interactive dashboards that combine the app's UI with ML-driven insights, making operational decisions and reporting faster.
• Used large language models (LLMs) with Python to add AI features to the applications.

Skills: React.js · Node.js · Express.js · Python · REST APIs · Machine Learning · Large Language Models (LLM) · Data Pipelines · Dashboards · MySQL

IEEE

Member

November 2024 - April 2026 (1 year 6 months)

university of cincinnati

Active member of the IEEE student community at the University of Cincinnati. Took part in technical workshops, coding competitions and networking events, which helped me grow my technical, teamwork and communication skills.

University of Cincinnati

10 months

Artificial Intelligence Researcher

April 2025 - October 2025 (7 months)

Cincinnati, Ohio, United States

Researched and built machine learning models to predict drone propeller noise, working with real sensor data.

• Built and optimized ML models using Python, TensorFlow and Scikit-Learn to predict and reduce drone propeller noise for better aeroacoustic performance.

• Engineered features from sensor data such as RPM, frequency and decibel levels.

• Applied hyperparameter tuning to lower prediction error and make the models more robust.

• Designed end-to-end data preprocessing and model evaluation pipelines.

• Measured model quality with precision, recall and F1-score across multiple validation splits.

Skills: Python · TensorFlow · Scikit-Learn · Machine Learning · Deep Learning · Feature Engineering · Hyperparameter Tuning · Model Evaluation · Pandas · NumPy

Data Science Advisor

January 2025 - March 2025 (3 months)

Cincinnati, Ohio, United States

Supported University of Cincinnati researchers with their data science work and the technical problems that blocked it.

• Debugged R package compilation and installation errors so researchers could run their analysis code.

• Helped researchers set up and run their data analysis workflows in R and Python.

Skills: Data Science · R · Python · Debugging · Data Analysis

Education

University of Cincinnati

Master's degree, Computer Science · (August 2024 - April 2026)
